Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A.Residues: 1-113 cARP>
C.Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine.
C.Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap, hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into lactisuperfamily: immunoglobulin V region; immunoglobulin homology
C.Keywords: heterotetramer
F.16-95/Domain: immunoglobulin homology < IMM>
F.13-93/Disulfide bonds: #status predicted

                                                                                                                                                                                                                    This sequence represents complementarity determinating region 1 (CDR L1) of the light chain of murine anti-CD23 (FCERII) monoclonal antibody C11 (see also AAY32262). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of C11 light and heavy chain CDRs (see AAY3224-59) to render them capable of binding to the CD23 type II molecule expressed on heematopoidetic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, are used to block soluble CD23 formation for treatment of arthritis, clubus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatifis, psoriasis, unticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogrem's syndrome, allergies, allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, eczema, graft-versus-host disease, COPD, insulitis, bronchitis diabetes, and B-cell malignancies (Claimed). They are also useful for studying interactions between CD23 and various ligands and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse; humanised antibody; CC-chemokine receptor 2; CCR2; nephrotropic; neuroprotective; immunosuppressive; human immunodeficiency virus; HIV infection; cytostatic; vasotropic; leukocyte trafficking; allergy; inflammatory disorder; autoimmune disorder; rheumatoid arthritis; shock; multiple sclerosis; atherogenesis; atherosclerosis; restenosis; asthma; anaphylaxis; malignancy; inflammation; stenosis; allograft rejection; fibrotic disease; angioplasty; acquired immune deficiency syndrome; host; inflammatory glomerulopathy; vascular intervention; neointimal hyperplasia; VK; kappa light chain variable region.
                                                                                                               Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The comprisions are useful for inhibiting the interaction of a call expressing CR2. They are useful for inhibiting the interaction of a call expressing CR2. They are useful for inhibiting or treating CR2 mediated disorders such as showner or inflammatory disorder, autoimmune disorders such as rheumatorid arthritis and multiple sclerosis, atherogenesis and atherosclerosis, and in the manufacture of a medicament for treating CR2-mediated classase. They are also useful for treating allergy, anaphylaxis, and in the manufacture of a medicament for treating allergy, anaphylaxis, can discuss they are also useful for treating allergy, anaphylaxis, complicated allergic reaction, shock, seroosis, allograft rejection, ender fibrotic disease, asthma, inflammatory glomenlopathies, acquired immune deficiency syndrome (AIDS), restenosis associated with vascular continuency discussed in a mammal, and inhibiting narrowing of the content of a vessel in a mammal, preferably associated with vascular intervention.

CC The present sequence is mouse germline kappa light chain variable (VK) region, 167/24.
Humanized immunoglobulin for treating a CC-chemokine receptor 2-mediated disorder in a patient, comprises a binding specificity for CCR2, and a non-human antigen binding region and human immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                              Region
 This sequence represents the light chain variable region (VL) of humanised anti-CD23 (FCERII) monoclonal antibody C11, composed of a human framework (HSIGNYII) and the light chain complementarity determining regions (see AAY3254-56) of murine antibody C11. The DNA was constructed by splice overlap PCR. The invention provides attered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, chapters, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, crohn's disease, Sjogram's syndrome, allergies, allergic asthma, intrinsic asthma, acute asthma, antibodies when its catchma, acute asthmatic exacerbation, rhinitis, ezema, graft-versus-host disease, CODD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly fronic bronchitis) or diabetes), and B-cell malignancies (Claimed). They are also useful for studying interactions between CD23 and various ligands and

                                                                                                                                                                This sequence represents the light chain variable region (VL) of murine anti-CD23 (FCERII) monoclonal antibody Cl1. The invention provides altered antibodies, such as chimeric or humanised antibodies (see AAV32262 and AAV32263), which comprises sufficient of the amino acid sequences of the Cl1 light and heavy chain complementarity determining regions (see AAV32264-59) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble copplements in human therapy, for the treatment of arthritis, classes, uncertainty dermation, hashimoto's thyroiditis, multiple sclenosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogren's syndrome, allergic asthma, intrinaic asthma, acte asthmatic exacerbation, rhinitis, ecema, graft-versue-host disease, COPD, insulitis, bronchitis (particularly chronic bernonfitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and
Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -

                                                                                                                                                                                                                                                                                                                                                                                                         AAW39818-20 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 6A12, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-bancoic acid from 3H-phenyl cocaine. The 6A12 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6A12 has a per minute Kcat 60 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).

The present sequence represents the light chain of a catalytic antibody which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAs) were presented and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be
Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue; TSA; benzoic acid, phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the light (kappa) - chain variable (V) region of a mouse monoclonal antibody (MAb), 2E12, and is specific for an HIV-1 viral antiben. It is used in the construction of a chimeric MAb comprising heavy and light chains having murine V regions and human C regions. The chimeric MAbs are more effective than murine MAb beavy and light chain V-regions are more effective than murine MAb heavy and light chain V-regions to generate restriction enzyme respective joining (J) regions, to generate restriction enzyme recognition sites. The chimeric MAbs can be used as immunotecolyates, in association with e.g. toxins for HIV treatment. They can also be used in diagnosis of HIV.
                             The mouse VL gene product may be used to produce chimeric mouse-
human Abs against HIV-1 comprising human Ig constant regions and
murine variable regions. These novel sequence are useful in
treatment, diagnosis and prophylaxis of HIV infections, and may be
produced by a bacterial, yeast or mammalian expression system.

                                                                                                                                                                                                                                                                                                                            of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2AlO antibody (AAW39809 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2AlO has a per minute Koat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAW39815-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 3B9, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoseter transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that

AAW39824-26 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 12H1, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Garalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSA2, and has a per minute Kcat of 0.16. The antibodies particularly for the treatment of an overdose. They are also used for treatment of an overdose. They are also used for treatming addiction (by reducing the in vivo concentration that can be
                                                                                  Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue, TSA, benzoic acid; phenyl cocaine, immunogenic conjugate, reduction, cocaine, treatment; overdose; addiction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding
Light chain CDR1 of catalytic antibody 12H1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 17; Page 83; 147pp; English.

AMM39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody (AMM39806 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs)

A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be

A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody (AAW39808 represents the heavy chain) was identified using TSA2, and has a per migute Kcat of 0.016. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 6Al2 antibody (AAW19807 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6Al2 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

--- SUBUNIT: HOMODIMER, U-SHAPED.
--- MISCELLANEOUS: THE 4 SITES PROPOSED FOR BINDING TO CARBOHYDRATES (N-ACETYL-D-GIJUCOSAANIE) OF RECEPTOR MOLECULES ARE ON THE SURFACE OF THE AGGLUTININ MOLECULE.
--- SIMILARITY: THERE ARE THREE VARIANTS OF WGA; VARIABILITY AMONG THEM IS OBSERVED AT A TOTAL OF 10 POSITIONS.
--- SIMILARITY: CONTAINS 4 CHITIN-BINDING DOMAINS.

MOI Immunol. 17, 711-718, 1980
A) Title: Amino acid sequence of the light chain variable region of M511, a phosphorylchd A) Reference number: A01910; MUID:81052016; PMID:6776396
A) Recession: A01910
A) Molecule type: protein
A) Residues: 1-113 AAPP>
C; Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine.
C; Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine.
C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kappain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into Ia C; Neywords: heterotetramer
C; Neywords: heterotetramer

A;Title: Sommatic mutation of immunoglobulin light-chain variable-region genes.

A;Reference number: A01909; WUID:82002223; PMID:6791832

A;Accession: A01909

A;Residues: 1-120 <SEL-

A;Note: the sequence was determined from the germline gene
C;Genteics: A;Introns: 17/1

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C;Superfamily: immunoglobulin V region; immunoglobulin homology
